

Brain labeling and registration

A photograph showing a person in a white lab coat and purple gloves holding a human brain. The brain is resting on a white surface, likely a surgical table. Various surgical instruments, including forceps and a scalpel, are visible on the table. The scene is dimly lit, with a bright light source illuminating the brain and the person's hands.

Why label brains?

Why label brains?

Labels visually augment anatomy

- teach anatomy
- guide surgery

Why label brains?

Labels visually augment anatomy

- teach anatomy
- guide surgery

Labels break up data

- process data by region
- quantify and report data by region

Why label brains?

Labels visually augment anatomy

- teach anatomy
- guide surgery

Labels break up data

- process data by region
- quantify and report data by region

Labels identify corresponding objects

- communicate using the same terms
- compare data across subjects and studies

Labels

Registration-based labeling

Registration-based labeling

Registration-based labeling

atlas

target

Registration-based labeling

Step 1: compute registration transform

Registration-based labeling

Step 2: apply transform

Registration-based labeling

What types of registration are there?

Classify by number of degrees of freedom (dof)

affine (12 dof)

nonlinear (>12 dof)

12 dof: 3 translations, 3 rotations, 3 scales, 3 shears

Classify by registration steps

1. Similarity metric: (n)CR, SSD, MSD, (n)CC, MI,...
2. Transformation model: affine, piecewise linear, nonlinear,...
3. Regularization method: multi-resolution/scale, Gaussian blur,...
4. Optimization strategy: simplex, gradient descent,...
5. Interpolation type: nearest-neighbor, trilinear, cubic, sinc,...

Classify by space registering in/to

What other applications are there for registration?

1. morphometry

template

target

2. anatomical localization

3. “spatial normalization” for group analysis

How accurate is a registration?

How accurate is the *anatomical* correspondence?

Software	Similarity metric	Transformation
SyN	CC	bi-directional diffeomorphism (D)
ART	nCC	FFD based on cubic splines (H, np)
IRTK	nMI	cubic B-splines
SPM5 DARTEL	multinomial model: congealing	FDM of viscosity field (Dc)
JRD-fluid	Jensen-Rényi divergence	viscous fluid; variational calculus (D)
Diffeomorphic Demons	SSD	displacement field (D, np)
FNIRT	SSD	cubic B-splines
ROMEO	displaced frame difference	local affine
ANIMAL	CC	local translations
SICLE	SSD	3-D Fourier series (D)
SPM5 Unified Segment	generative segmentation	discrete cosine transforms
SPM5 “SPM2-type”	MSD	discrete cosine transforms
SPM5 Normalize	MSD	discrete cosine transforms
AIR	MSD	5th-order polynomial warps
FLIRT (linear)	nCR	linear, rigid-body

n = normalized	D = diffeomorphic
CC = cross-correlation	Dc = diffeomorphic, constant over time
CR = correlation ratio	FDM = finite difference model
MI = mutual information	FFD = free-form deformation
MSD = mean of squared differences	H = homeomorphic
SSD = sum of squared differences	np = nonparametric
